On the Spectral Composition of the Radiation and the Temperature of the Carbon Arc in Argon and Helium

Measurements on the lines of ionized carbon, CII 2,509.11 (excitation potential 18.67 ev) and CII 2,836.71 (excitation potential 16.34 ev) made in a previous investigation (Ref. 7) proved that in direct vicinity of the cathode the temperature is near 20,000°K but is lower in other discharge portions. The measurements in argon gave analogous results. In general, it was revealed that lines of all elements including helium are excited in a carbon arc. Lines with high excitation energies (ArII, CII, CIII and more) appear in the spectrum of the spot at the cathode only. The maximum intensity of the copper lines 5,105.541 and 5,153.235, by which the temperature is usually being measured, is reached in argon and helium environment not on the arc axis but at the periphery, i.e., in colder sections with about 6,700-6,800°K. Therefore, the temperatures measured in this way in argon and helium are neither the mean values for the entire discharge nor the maximum values, but show the temperature in the zone of the highest radiation of these lines. The existence of a high temperature in the arc discharge in argon and helium can be utilized in practical analysis techniques for higher accuracy of determination of the elements, the analytical lines of which

On the Spectral Composition of the Radiation and the Temperature of the Carbon Arc in Argon and Helium

axial symmetry of it can be established. Only a small part of the spectrograms made could be processed using the Hörman method (Ref. 5). Curves were plotted and the dependence of the intensity $i(r)$ on the radius r across the arc cross section area was calculated by graphical solution of the Abel equation

$$i(r) = \frac{1}{\pi} \int_r^R \frac{i_x(x) dx}{\sqrt{x^2 - r^2}}$$

where $i(x)$ is the intensity of radiation of a volume unit at the distance x from the discharge axis. The discharge temperature was determined by the relative intensities $i(r)$ of the copper lines, using the formula (Ref. 6)

$$T(r) = \frac{11987}{1g \frac{i(r)_{5105}}{i(r)_{5153}}} + 1.82$$

Marzuyanov, V.L.

TITLE: On the Spectral Composition of the Radiation and the Temperature
of the Carbon Arc in Argon and Helium

PERIODICAL: Vestnik Akademii nauk Kazakhskoy SSR, 1960, No. 9 (186), pp. 85-91

TEXT: The behavior of a carbon arc in argon and helium environment was studied and its spectral radiation composition and the temperature of the core were measured. The discharge was produced in a quartz tube. Gas was blown through the tube. The arc gap was held at 5 mm; the arc was fed with 10 amp d-c; the radiation from different discharge parts onto the spectrograph slit was projected by a mirror system. A photo of the installation is given. The carbon electrodes had a crater in the bottom electrode which was filled with carbon powder containing 1 % copper. Spectra were recorded in the wavelength range of λ 2,250-8,000 Å. The observed luminescent discharge cloud was different in argon and in air; the intensity of the spectral lines was distributed on the arc length and across the arc. It was stated that the central hottest portion of discharge is in fast transversal motion and therefore no

(Heat-resistant alloys--Testing)

137-1957-12-15415

The IP-4M Testing Machine for Creep and Endurance Strength

type are employed in the thermocouple circuits. Automatic temperature compensation for the free terminals of thermocouples is accomplished by means of a special unit of the KT-54 type, group KhA. The mechanical system of the machine remained essentially unaltered. All component units of the IP-4 M machine have exhibited sufficient strength and reliability required for the experiments during long periods.

TITLE: The IP-4M Machine for Determining long-Time Tensile Strength of
(Mashina dlya ispytaniya na polzuchest'-dlitel'nuyu prochnost'
IP-4 M)

PERIODICAL: V sb.: Prochnost' metallov. Moscow, AN SSSR, 1956, pp 91-99

ABSTRACT: A description of design changes performed on the IP-2 testing machine in order to explore the simplest and the most reliable methods for testing metals at elevated temperatures. Specifications for the new testing machine IP-4 M (improved IP-2 model), developed at the TsNIITMash, are shown. Temperature regulation in the furnace of the IP-4 M is accomplished automatically by means of an EPD-17 potentiometer; in addition, the furnace is equipped with a dilatometric temperature regulator, which controls the electronic potentiometer and also regulates the temperature in the event of failure of the potentiometer or the thermocouple. A control panel ensures temperature regulation at 108 points. Temperature is measured by means of a PP-11 potentiometer of class 0.25, with a range of 0 to 71 mv. Jack switches of PD-6

Conference on Problems of Automobile Engine Life

117-3-26/28

In the report "The Problem of Choosing Antifriction Alloys for Automobile Bearings", Candidate of Technical Sciences N.M. Rudnitskiy (of NAMI) spoke of a new, USSR made, anti-friction alloy "COC6-6" consisting of 88% lead, 6% antimony, and 6% tin, which is used by 4 plants making automobile bearings. At the Moscow Automobile Plant imeni Likhachev, this alloy brought about an annual saving of 21 million rubles. It can be used for the new heavy-duty 3-layer bearings.

Engineer B.M. Grindorf (Middle-Asian Polytechnic Institute) delivered the report "Increasing the Wear Resistance of Engine Cylinders by the Use of Metal-Ceramic Linings". Engineer D.I. Bran (NIITAvtoprom) reported on increasing the life of valves by aluminizing the facets.

Engineer V.S. Zavel'skiy (NAMI) pointed out in his report "Corrosion Sensitivity of Cast Iron to Sulphur Oxides" that the corrosion of engines has become acute on account of the highly sulphurous fuels used at the present time. He described the tests carried out at NAMI, in which the cylinder-and-piston units were run in sulphurous gas, and the wear was measured by the method of radioactive isotopes. It was concluded that the sulphurous anhydride forming at the burning process can produce gas corrosion at high temperature, which

Scientific principles of engineering group production (Nauchnyye osnovy tekhnologicheskay podgotovki gruppovogo proizvodstva) Moscow, Izd-vo "Mashinostroyeniye", 1965, 394 p. illus., biblio. 6,000 copies printed.

TOPIC TAGS: production engineering, metal working machinery, metallurgic process, milling machine, drilling machine, metal casting, computer application

PURPOSE AND COVERAGE: This book gives the present condition and development of the organization of engineering group production in instrument and machine manufacture. The classifiers and methods of classification using computers are given. Also included are problems in using the group method in processing materials by sand casting, die casting, stamping from liquid metal, forging, and others. Problems of mechanical working with milling, drilling and aggregate units are given, as well as improved structures of fittings and repairs used in the Soviet Union and abroad. This book is recommended for technical engineers and scientists and it can also be useful for students in institutes of technological specialties.

Mitrofanov, S. P. (Doctor of Technical Sciences, Professor)

Scientific fundamentals of the organization of multiple machining in industrial production (Nauchnye osnovy organizatsii gruppovogo proizvodstva), Moscow, Mashgiz, 1963, 304 p. illus., biblio. 3,200 copies printed.

TOPIC TAGS: machining, multiple machining, machine building, instrument building, machine tool design, production planning, automation, assembly line production, industrial engineering, standard

PURPOSE AND COVERAGE: The book considers the state of the art and the direction of development of the theory and practice and machine building and instrument building technology based on the unification of technological processes. The basic problems of the development and introduction of multiple machining as the basis of mechanized assembly line production are illuminated. Material is given on the design of machine tool accessories, the modernization and specialization of equipment, the design of assembly-line and automated lines, standard establishment, planning and organization of production. The book is intended for engineers and technicians and researchers. It also will be useful for students and teachers of higher educational institutions.

reported that formerly one plant produced 200 different shafts, axles, and bolts and more than 180 different covers on 35 machines in several engine rooms; now, all these workpieces are produced in one assembly line consisting of 14 machines (Fig. 15). The automation of assembly lines gives automatic lines. A train put into operation in Leningrad in 1956 produces 63 different types of relay with the aid of 16 cutting tools. Formerly, 79 one-step cutting tools were required for this purpose. This increased the output by the 13-fold, reduced the costs by the 1.3-fold, and saved about 0.5 million rubles in 1958. On another automatic line, 420 different screws can be produced in two operations. In 1957-58, the Testing Laboratory of Machine Building, together with the Stankokon-struktsiya Works, established two automatic group lines for the machining of shafts and pinions. Thus, the method of group production created the possibility of fully automatic machining of workpieces in small series. There are 21 figures.

Problems of mechanization and automation ... G/018/61/010/005/002/003
B120/B203

Various types of stepped shafts 100-500 mm long and 25-80 mm in diameter can be made with the 1A62 turning lathe. These turning lathes can be automatized by installing a KST-1 hydrocopying slide and a pneumatic automatic system. The efficiency of capstan lathes is increased by the attachment of radial multistage stops, copying devices, and multiple tool holders for thread cutting. Milling machines can be provided with multisindle heads, drilling machines with detachable turretheads. Sets of machines are conveniently composed by the assembly-type system. With the introduction of a preset course, the output of a turning lathe can be increased by the 2-2.5-fold; one worker can attend to 2-3 semiautomatic lathes. The following operations can be made with a 1P326 capstan lathe: roughing and smoothing, profiling, drilling, countersinking, reaming, facing and grooving, knurling, and cutting off. 60,000 rubles a year were saved on four machines by introduction of multi-machine operation. With the principle of group machining, the production by assembly lines is also possible in small series. Differences in the technological working plan may occur due to differently long machining of single workpieces within a group, and subgroups are formed. It is

AUTHOR: Mitrofanov, S. P., Doctor, Lenin Prize Winner (Leningrad)

TITLE: Problems of mechanization and automation under conditions
of group manufacturing

PERIODICAL: Feingerätetechnik, v. 10, no. 5, 1961, 199-208

TEXT: Until a few years ago, the application of automatic production and machining methods was for economic reasons only possible with mass-produced articles. If, in the production of numerous small series, workpieces similar in design and technology are assembled into groups, each of these groups can be processed by one machine with quick adjustment. The article describes how it is possible to attain gradual automation of the production of small series. The first step of the reorganization of production for group machining is the reconstruction of available machines. Fig. 3 shows a diagram of the machining of a single part on a turning lathe, all working steps being completed in two operations. For this purpose, the lathe was equipped with an 8-step turret-head, swiveling cross slide, and longitudinal and transverse stops.

The Tasks of Instrument Builders

out complete automation and mechanization in three Leningrad plants in 1963: viz., Leningradskiy elektromekhanicheskiy zavod (Leningrad Electro-Mechanical Plant), Petrodvortsovyy chasovoy zavod (Petrodvorets Watch Plant), and the Zavod "Soyuz" ("Soyuz" Plant). It is pointed out that the work of separate scientific-research institutes and planning organizations should be coordinated in order to avoid duplication of efforts. For this reason, scientific-technical coordination centers should be created. Technical problems should also be dealt with by scientific-technical societies to which approximately 800,000 scientists, engineers, technicians and workers-innovators belong. In Leningrad only, the 19 existing scientific-technical branch societies have more than 1100 local organizations and more than 54,000 NTO members, a number including 63 NTO instrument building organizations with 3000 members and 94 radio engineering and electrocommunication organizations with 4300 members.

The Tasks of Instrument Builders

2.6 times an amount including a 4.5 to 4.7 times increase computing devices, a more than 5 times increase in power control devices, an almost 3 $\frac{1}{2}$ times increase in electrical measuring devices, a 2.8 times increase in radio-measuring devices, etc. The Leningrad industrial region is the most important because it manufactures almost all kinds of instruments. It is pointed out that a series of these instruments and devices do not meet the requirements of modern technology, and must be replaced. In the next 2-3 years, 23% of devices must be modernised and replaced 16% of them by new ones released by the Leningrad industry in 1959. More than 1000 new devices and automation means must be developed and their series manufacture organized. An important task of the instrument builders of not only Leningrad but the whole country, is the maximum standardization of all instruments and the creation of unified sets permitting the development of control system using standard units and normalized components. The Upravleniye priborostroitel'noy promyshlennosti (the Administration of the Instrument Industry) at Lensovmarkhoz is planning to carry

TITLE:

The Tasks of Instrument Builders

PERIODICAL:

Izvestiya vysshikh uchebnykh zavedeniy. Priborostroyeniye, 1960,
Vol. 3, Nr 1, pp 3-9 (USSR)

ABSTRACT:

This is a general review of the development of instrument building in the Soviet Union and especially in the Leningrad administrative region. In 1959, the instrument and machine manufacturers of Leningrad produced more than 600 new machine and instrument types against 570 foreseen by the plan. The Admiralteyskiy zavod (Admiralty Plant) released the first atomic icebreaker, the "Lenin". A short statistical comparison of the production in the Soviet Union and the U.S.A. is given: Between 1950 and 1957, instrument manufacture was increased by 13 times in the USSR and in the U.S.A. only by 3 times. Nevertheless, instrument building still lags in the USSR because it fails to meet the requirements for the automation of industrial processes. Total industrial production is to be increased by 80% according to the plan, while instrument production must be increased by 2.5 ~

Scientific-Industrial Conference on "Advanced Machine and Instrument Manufacturing Processes," held in 1958. The papers have been revised in the light of recent developments in the field. A chapter is devoted to the automation and mechanization of the industry. Soviet and non-Soviet references accompany some of the chapters.

Sovremennoye sostoyaniye i napravleniya razvitiya tekhnologii mashinostroyeniya i priborostroyeniya (Present State of the Manufacturing Processes in the Machine and Instrument Industries and Trends for Development) Moscow, Mashgiz, 1960. 563 p. 5,000 copies printed.

Ed.: Anatoliy Nikolayevich Gavrilov, Doctor of Technical Sciences, Professor; Managing Ed. for Literature on Machine Building and Instrument Construction (Mashgiz): N.V. Pokrovskiy, Engineer; Ed. of Publishing House: G.F. Kochetova, Engineer; Tech. Eds.: V.D. El'kind and A.Ya. Tikhonov.

PURPOSE: This book is intended for technical and scientific personnel in the machine and instrument industries and for students and teachers of schools of higher education.

COVERAGE: The book deals with current theory and practice in the manufacturing processes of the machine and instrument industries and includes discussions on trends for development. The physical nature of the processes and their technical-economic features and possibilities are considered. Particular attention is given to new and progressive processing (supersonic machining, electric machining, cold pressworking, precision casting, precision pressing, new methods of welding, etc.). The book consists of papers presented at the All-Union

Examples are given for the grouping of parts according to shape or special processing features. Constructions for group-machining fixtures are presented, and certain problems encountered in parts machining, fixture design, and cutting regimes are discussed. Calculations relating to the economic effectiveness of various types of jigs and fixtures are included in some of the articles. No personalities are mentioned. There are no references.

Nauchnyye osnovy gruppovoy tekhnologii (Scientific Fundamentals
of Group Manufacturing Methods) [Leningrad] Lenizdat, 1959.
434 p. 20,000 copies printed.

Scientific Ed.: M. A. Anserov; Eds.: N. Z. Simanovskiy and P. I.
Malyavko; Tech. Ed.: P. S. Smirnov.

PURPOSE: This book is intended for engineers and technicians and
may be used as a handbook by students of industrial trades.

COVERAGE: The book gives a detailed and systematic treatment of a
group method of manufacturing. Methods of setting up technical
group processes for turning lathes, turret lathes, milling
machines, drilling machines, automatic turning lathes, and also
in-parts production, die casting, and hot drop forging are
reviewed. Special attention has been given to the problem of
setting up group production lines. The book also deals with the

In the introduction of every slide page is explained, and practical recommendations given, the improvement of small slide parts, their design, their production, their quality control, their use, their service, their maintenance, and their repair. Effects resulting from their use, and methods of designing and producing them are discussed. New designs of hydraulic slide tools are described. Requirements for small shop problems of program control, especially as it concerns the design of programs, and a number of the original experiments described. Automation problems involved in the given industry are discussed. 16 Models and 12 English summaries are attached. There are 37 references.</p> <p>Editor: Tadeusz Szwarcowicz, Professor Editor: V. I.
